

### Standard Prompting

#### Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

#### Model Output

A: The answer is 27. ❌

### Chain of Thought Prompting

#### Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls.  $5 + 6 = 11$ . The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

#### Model Output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had  $23 - 20 = 3$ . They bought 6 more apples, so they have  $3 + 6 = 9$ . The answer is 9. ✅

React

Thought + Action + Observe → Final Answer.

Did our store hit the Q2 Target?

Target: Revenue must grow by 20% from Q1 to Q2

Thought: I need q1, q2, and compute percentage.

Action: query-sales (q1)

Observation: q1 = 10k

Thought...

Thrashing:

1. thought: I should search q2 results; action: search\_web(q2 sales target);  
output: irrelevant result
2. thought: I should search q2 results; action: search\_web(store revenue q2 sales); irrelevant result.

## React Agent: Every Call Brings More Baggage

|                                                 | WHAT THE MODEL SEES (CONTEXT)                                                                                        | CONTEXT SIZE (KEEPS GROWING)                                                                      | WHY REACT GETS EXPENSIVE OVER TIME |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|------------------------------------|
| <b>CALL 1</b><br>Let's get started! 🎉           | <div>PROMPT — your task</div> <div>TOOL SCHEMAS — what tools I can use</div>                                         | =  SMALL       | Cheap 😊                            |
| <b>CALL 2</b><br>Got it, let me do a thing... 🤔 | <div>PROMPT</div> <div>TOOL SCHEMAS</div> <div>OBSERVATION 1 — result from previous action</div>                     | =  BIGGER      | More tokens, more money 💵          |
| <b>CALL 3</b><br>Okay, new info unlocked 🔑      | <div>PROMPT</div> <div>TOOL SCHEMAS</div> <div>OBSERVATION 1</div> <div>OBSERVATION 2</div>                          | =  EVEN BIGGER | Getting pricey 😬                   |
| <b>CALL 4</b><br>We're deep now bruh 😩          | <div>PROMPT</div> <div>TOOL SCHEMAS</div> <div>OBSERVATION 1</div> <div>OBSERVATION 2</div> <div>OBSERVATION 3</div> | =  HUGE        | Ouch. My wallet is crying 🥲        |
| ...                                             | <div>... MORE OBSERVATIONS</div>                                                                                     | =  MASSIVE     | Send help. 🧛                       |

☆ Each call includes: PROMPT + TOOL SCHEMAS + ALL PREVIOUS OBSERVATIONS  
⇒ Context keeps growing, tokens keep burning.

MORE CONTEXT =  
MORE \$\$\$

③

## Plan & Solve

1. get Q1 revenue
2. get Q2 revenue
3. Get growth target
4. Compute difference
5. Compute percentage

Frameworks, Workflows work very well!!  
Thumb rules, KISS, keep it sweet and simple.

## Rewoo Reason without Observation.

1. get Q1 revenue -> {"tool\_name", "args"}
2. get Q2 revenue -> {"tool\_name", "args"}
3. Get growth target -> {"tool\_name", "args"}
4. Compute difference -> {"tool\_name", "args"}
5. Compute percentage -> {"tool\_name", "args"}

### 4. Self Consistency

You ask same question to a llm with high temperature. Do a majority voting on the answer.

## Reflection

### 1. Self-Refine

includes same LLM reviewing the answer. Tone of answer, temperament ( the flow of words)

### 2. Reflexion

Agent tries a task  
Environment gives the feedback  
Agent writes a lesson  
Lesson is stored in memory  
Agent retries with learnt lesson.

hermes - Tests

### 3. CRITIC

Judging output by TOOL-CALLS,

Error/success result from tool-call can act as review.

What's the current algorithm for linear topology:  
web\_search (linear topology)

### 4. LLM as a judge

Mostly useful for subjective/semi-subjective kind of answer.

don't just use LLM with system prompt of "Review following answer"

- a. empathy
- b. Accuracy
- c. tone
